Gene encoding an antigen recognizing an antibody which induces granulocyte colony stimulating factor (G-CSF) expression for gene therapy and treatment of G-CSF associated disorders e.g. the side effects of cancer therapy.

Claim 2; Page 49-50; 58pp; Japanese.

The present invention relates to a gene encoding an antigenic protein recognised by an antibody or its fragments which can induce the production of granulocyte colony stimulating factor (G-CSF). Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene is used for gene therapy, and compounds identified by screening using the gene sequence are used for treatment and prevention of disorders therapy (including bone marrow suppression). The present sequence represents the murine antigen of the invention

The invention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (WTf-BP) and a membrane bound type transferrin-like protein (WTf) and an animal-derived concanavalin-like drug. The cartilage differentiation stimulator can be used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTf-BP strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant

The invention relates to a mouse or human gene (MMR19) encoding a protein which binds to antibodies or their fragments which induce granulocytecolony stimulating factor (G-CSF) secretion. The genes and proteins of the invention are used in diagnosis, treament and prevention of diseases associated with G-CSF, including infections and neutrophil deficiency disease. This sequence represents a mouse G-CSF-inducible antibody binding protein, MMR19

Homo sapiens 18-JUN-2002 23-JAN-2002 Invention AAU78360; AAU78360

The invention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (WTF-BP) and a membrane bound type transferrin-like protein (WTF)) and an animal-derived concanavalin-like drug. The cartilage differentiation stimulator can be used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTF-BP strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant derived ConA. This is the animo acid sequence of a cartilage cell differentiation stimulator associated polypeptide described in the

SMIK) SMITHKLINE BEECHAM CORP

Demarini DJ;

WPI; 1999-083567/08 N-PSDB; AAX05748. New HFIZG53 polypeptide and polynucleotide - useful as diagnostic reagents and for prevention and treatment of inflammatory diseases, cancer and Parkinson's disease.

Claim 11; Page 7; 22pp; English.

This represents the amino acid sequence of human HFIZG53. Host cells containing an expression system comprising the HFIZG53 nucleic acid are used for the recombinant production of the protein. HFIZG53 polypeptides can deplymucleotides are useful for diagnosing diseases related to over or underexpression of HFIZG53 protein. The HFIZG53 polypeptides can be used to extivate or inhibit HFIZG53 activity. Gene therapy may also be used to affect endogenous polypeptide production, using HFIZG53 polymelectides and retroviral vectors. HFIZG53 activity. Gene therapy may also be used to affect endogenous polypeptide production, using HFIZG53 polymucleotides and retroviral vectors. HFIZG53 antibodies are useful for inducing an immune response to immunise and prevent diseases, and for isolating the HFIZG53 clones or purifying the polypeptide by affinity chromatography. HFIZG53 clones or purifying the polypeptide by affinity chromatography. CF HFIZG53 polypeptides can be administered directly or as a vaccine to inculude inflammatory diseases prevented, diagnosed or treated include inflammatory diseases prevented, diagnosed or treated cinclude inflammatory diseases prevented, diagnosed or treated cincluding testicular cancer; and other immunodeficiency disorders; infections including bacterial, fungal, protozoan and viral, particularly HIV-1 and -2; HIV-associated cachexia and other immunodeficiency disorders; septic shock; injury; pain; cancers including testicular cancer; ancrexia; bulimia; Parkinson's disease; cardiovascular disease including restenosis, atherosclerosis, acute heart calciure, myocardial infarction, hypotension, hypertension, urinary retention; angina pectoris; ulcers; benign prostatic hypertension, urinary cetention; angina pectoris; ulcers; benign prostation) and dyskinesiae, mannic depression, dementia, severe mental retardation) and dyskinesiae, such as Huntington's diseases or Gilles de la Tourette's syndrome. ```
The invention relates to a mouse or human gene (MMR19) encoding a protein which binds to antibodies or their fragments which induce granulocytecolony stimulating factor (G-CSF) secretion. The genes and proteins of the invention are used in diagnosis, treatment and prevention of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, granulocyte-colony stimulating factor, G-CSF, MMR19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a gene encoding an antigenic protein recognised by an antibody or its fragments which can induce the production of granulocyte colony stimulating factor (G-CSF). Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene is used for gene therapy, and compounds identified by screening using the

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities,

discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB57072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ftp.wipo.int/pub/published_pct_sequences

Birse CE, Barash SC, Ruben SM,

Rosen CA;

WPI; 2001-235357/24. N-PSDB; AAH33805 Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.

Claim 11; Page 6841; 9803pp; English

example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAH77789 represent AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25, SEQ ID NO 45375; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC of the nucleic acid inhibits proliferation is inhibited by the antisense canceling a polypeptide expression is inhibited by the antisense conclain a polypeptide whose expression is inhibited by the antisense control its fragment whose expression is inhibited by the antisense control its fragment whose expression is inhibited by the antisense control its fragment whose expression is inhibited by the antisense control its fragment whose expression is inhibited by the antisense control its proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation; (9) manufacturing an antibiotic; (10) profiling a

compound's activity, (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate endidate molecules for rational discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of K. pretaget prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences DINEQDISGPPASKKLKKSQCTPLFMNAYTWRGAGAVIHTHSKAAVMATLLFPGQBFKIT 135 136 HQEMIKGIRKCTSGGYYRYDDMLVVPIIENTPEEKDLKERMAHAMNEYPDSCAVLVRRHG 195 118 NOBIIKALDIWEEGA-----TIHIPIIENHAHIPTLGENFRKHIQ--GDSGAVLIRNHG 169 196 VYVWGETWEKAKTMCECYDYLFDIAVSM 223 : ||| :: || :: || 100 IIIVWGRDSFDAKKRLEAYEFLFQFHIKL 197 60; Conservative 29 ELCKOFYHL-Best Local Similarity Sequence 212 AA; WO200277183-A2. 19-JUN-2003 03-OCT-2002 ABU41912; 96 Query Match Matches RESULT 13 ABU41912 555555555555555X8 ò à Q ò d ð

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the invention tenates to an instance acts compliance any wine the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid.

(2) a host cell containing the vector; (3) an isolated prolypeptide whose expression is inhibited by the antisense contisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular or the activity of a gene in an operom required for proliferation or the activity of a gene in an operom required for the gene product or that has an activity against a biological pathway or the gene product or that has an activity against a biological pathway or the gene product or that has an activity against a biological pathway or the gene required for cellular proliferation or the biological dentifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, sactivity, (11) a culture comprising strains in which the gene or the strains in spream tin a culture or collection of an organism or strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for the cellular proliferation or product andidate molecules for rational and the proverse andidate molecules for rational and the proverse andidate molecules for rational and the provention or the propertion or the series and additing molecules for rational and the provention or proventions and the provention or an organism or for extreming the molecules for rational and the provention or the provention or an organism or the provention or and organism or the provention or and organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29 ELCKQFYHLGWVTGTGGGISLKHGNEI-YIAPSGVQKERIQPEDMFVCDINEQDISGPPA 87

The invention relates to an isolated nucleic acid comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid conceding a promoter operably linked to the nucleic acid comprising a promoter operably linked to the nucleic acid conceding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated contisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding contisense nucleic acid; (4) an antibody capable of specifically binding contiseration or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway contiseration; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway contiseration; (3) antiseration, or that inhibits cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene compound that inhibits the product is overexpressed or underexpressed; (12) determining the extent compound section of an organism. The antisense nucleic acids are useful for fearlifying proteins or screening for homologous nucleic acids required for rational for cellular proliferation to isolate candidate molecies for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
Antisense; prokaryotic essential gene; cell proliferation; drug design.

```

```
drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

-!- COFACTOR: Binds 1 zinc ion per molecule (Potential).
-!- PATHWAY: L-arabinose catabolism; third step.
-!- INDUCTION: Transcription is repressed by glucose and by the binding of arak to the operon promoter. L-arabinose acts as an inducer by inhibiting the binding of arak to the DNA, thus allowing expression of the gene.
-!- SIMILARITY: Belongs to the aldolase class II family. AraD/fucA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            28-FEB-2003 (Rel. 41, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Due Sci. Technol. 1:53-75(1996).

FUNCTION: PROBABLE PENTULOSE-5-PHOSPHATE-4-EPIMERASE. PROBABLY
INVOLVED IN A METABOLIC PATHWAY WITH SGAH AND SGAU.

COFACTOR: Binds 1 zinc ion per molecule (Potential).

SIMILARITY: Belongs to the aldolase class II family. AraD/fucA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;

-!- CATALYTIC ACTIVITY: L-fuculose 1-phosphate = glycerone phosphate (S)-lactaldehyde.
-!- COFACTOR: Binds 1 zinc ion per molecule (Potential).
-!- PATHWAY: Fromcee metabolism; third step.
-!- PATHWAY: Homotetramer (By similarity).
-!- SUBUNIT: Homotetramer (By similarity).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
